*** ANNOUNCEMENT ***

--File 581 - The 2003 annual reload of Population Demographics is complete. Please see Help News581 for details.

--File 156 - The 2003 annual reload of ToxFile is complete. Please see HELP NEWS156 for details.

--File 990 - NewsRoom now contains February 2003 to current records. File 992 - NewsRoom 2003 archive has been newly created and contains records from January 2003. The oldest months's records roll out of File 990 and into File 992 on the first weekend of each month. To search all 2003 records BEGIN 990, 992, or B NEWS2003, a new OneSearch category.

--Connect Time joins DialUnits as pricing options on Dialog. See HELP CONNECT for information.

--CLAIMS/US Patents (Files 340,341, 942) have been enhanced with both application and grant publication level in a single record. See HELP NEWS 340 for information.

--SourceOne patents are now delivered to your email inbox as PDF replacing TIFF delivery. See HELP SOURCE1 for more information.

--Important news for public and academic libraries. See HELP LIBRARY for more information.

--Important Notice to Freelance Authors--
See HELP FREELANCE for more information

B The genus **Cordyceps** known as an insect parasite forms a sclerotium in insect bodies and then produces perithecia on the single or multiple stromata produced from sclerotium. Collected **Cordyceps** were identified into 5 species: **Cordyceps militaris**, **C. nutans**, **Cordyceps sphecocephala**, **Isaria japonica**, and **Torrubiella** sp. The **fruit bodies of Cordyceps** in petri-dish cover were fixed by tape and put the lid on water agar plates to isolate these collected **Cordyceps**. The germinated spores were transferred from water agar to Potato dextrose agar (PDA) after six hours. Mycelial growth of **C. nutans** and **C. militaris** was the most successful on Hamada media and was also good on Complete media and PDA. Mannose as a carbon source was good for two species and Glutamic acid as a nitrogen source was satisfactory to **C. militaris** and Asparagine gave a good result to **C. nutans**. **C. militaris** and **C. nutans** showed similar mycelial growth rate on the media that contained thiamine-HCl, biotine or nicotinic acid as a vitamin. When conidia of **C. nutans** were inoculated to insects, mortality was high in *Artogeia napi* L., Hemiptera, *Plutella xylostella* and 50% in Orthoptera, 12% in *Acantholyda posticalise* M, but not *Agelastica coerulea* B. in Aphididae, **C. nutans** was collected from only Hemiptera in nature, but killing effect on other insects was proved. Mycelial growth and **fruit-body** formation were good on the media that consist of rice powder 5 g, wheat flour 5 g, water 100 ml, but formed **fruit-body** was not complete stromata but a mass of conidia according to results of observing microscope.

AB A **Cordyceps** species arising from larvae of Lepidoptera was collected on 16 September 1994 in a plantation of Japanese larch at Ajigasawa town, Nishitsugaru-gun, Aomori prefecture. Based on the morphological features, this fungus was identified as **C. militaris**. Using this **Cordyceps** material and artificially grown pupae of *Mamestra brassicae* Linne, inoculation experiments to produce **Cordyceps fruit body** in the laboratory were performed as follows: ascospore suspension was prepared from the stroma of the fungus and the living pupae were immersed for a few minutes in this suspension. The pupae thus inoculated were placed on wet Sphagnum moss in deep Petri dishes and kept under diffuse sunlight in the laboratory (room temperature: 15-20 degree C). Forty days after inoculation, **fruit body** initials began to appear from the pupae, which continued to grow and finally were found to contain perithecia with mature asci and ascospores. Similar inoculation experiments were repeated three more times at room temperature or in a growth chamber with controlled temperature and light conditions (7.5-25 degree C). In each experiment, mature **fruit bodies** were formed on the inoculated pupae at high rates (13.8-76.0%).

L9 ANSWER 63 OF 64 CABA COPYRIGHT 2003 CABI

AB The control of basidiocarp initiation in mushrooms by CO₂ and microorganisms in casing material was studied under defined conditions using growth tubes. **Fruit bodies** were not produced in sterilized materials except when activated charcoal was included in the casing layer. Here responses to CO₂ were similar to those obtained in unsterilized casing where carpogenesis was associated with a check of **hyphal** growth over a restricted CO₂ concentration range of 100-1000 p.p.m.

ANSWER 31 OF 49 USPATFULL

AB There is disclosed a method for growing **fruit bodies** of *Fistulina hepatica* which comprises the steps of cutting off some parts of side wall of a cultivation vessel close to the fruit body primordium-forming part on a solid medium contained in the vessel having at least the bottom and side walls to form perforations on the wall, and making the **fruit bodies** to grow out of the vessel through the perforations. By this method, the large mature **fruit bodies** can be efficiently obtained in a short period of time.
